The screenshot shows a Python IDE with a file named '5.py' containing a linked list implementation. The code defines a 'Node' class with 'data' and 'next' attributes. It includes methods for initialization, searching for a node, and traversing the list. The main code creates a linked list with nodes containing values 18, 41, 11, and 59. It then searches for nodes with values 41 and 60, printing their status.

```
class Node(object):
    def __init__(self, data, next = None):
        self.data = data
        self.next = next
    def cari(self, cari):
        curNode = self
        while curNode is not None:
            if curNode.next != None:
                if curNode.data != cari:
                    curNode = curNode.next
            else:
                print("Data", cari, "ada dalam Linked List")
                break
            elif curNode.next == None:
                print("Data", cari, "tidak ada linked list")
                break
a = node (18)
menu = a
a.next = node (41)
a = a.next
a.next = node (11)
a = a.next
a.next = node (59)
menu.cari(41)
menu.cari(60)
```

The Python Shell output shows the execution of the code:

```
Python 3.8.2 Shell
Python 3.8.2 (tags/v3.8.2:7b3ab59, Feb 25 2020, 22:45:29) [MSC v.1916 32 bit (In
tell) on win32
Type "help", "copyright", "credits" or "license()" for more information.
>>>
= RESTART: D:\Kuliah\Semester 4\Tugas Praktikum Algoritma dan Struktur Data\MODU
L-04\5.py
Data 41 ada dalam Linked List
Data 60 tidak ada linked list
>>>
```

6.

The image shows a screenshot of a Python IDE with two windows. The main window on the left contains a Python script for a binary search algorithm. The script defines a function `binSe(kumpulan, target)` that takes a list and a target value. It initializes `low = 0` and `high = len(kumpulan) - 1`. A `while` loop runs as long as `low <= high`. Inside the loop, `mid = (high + low) // 2` is calculated. If `kumpulan[mid] == target`, the target is found and its index is returned. If `target < kumpulan[mid]`, the search range is updated to the left half (`high = mid - 1`). Otherwise, it's updated to the right half (`low = mid + 1`). If the loop ends without finding the target, it returns `False`. Below the function, a list `[38, 12, 99, 137, 299]` is defined, and two target values, `99` and `123`, are set. The script then prints the results of `binSe` for each target.

```
def binSe(kumpulan, target):
    low = 0
    high = len(kumpulan) - 1
    data = []
    while low <= high:
        mid = (high + low) // 2
        if kumpulan[mid] == target:
            data.append(kumpulan.index(target))
            return True
        elif target < kumpulan[mid]:
            high = mid - 1
        else:
            low = mid + 1
    return False

list = [38, 12, 99, 137, 299]
target1 = 99
target2 = 123

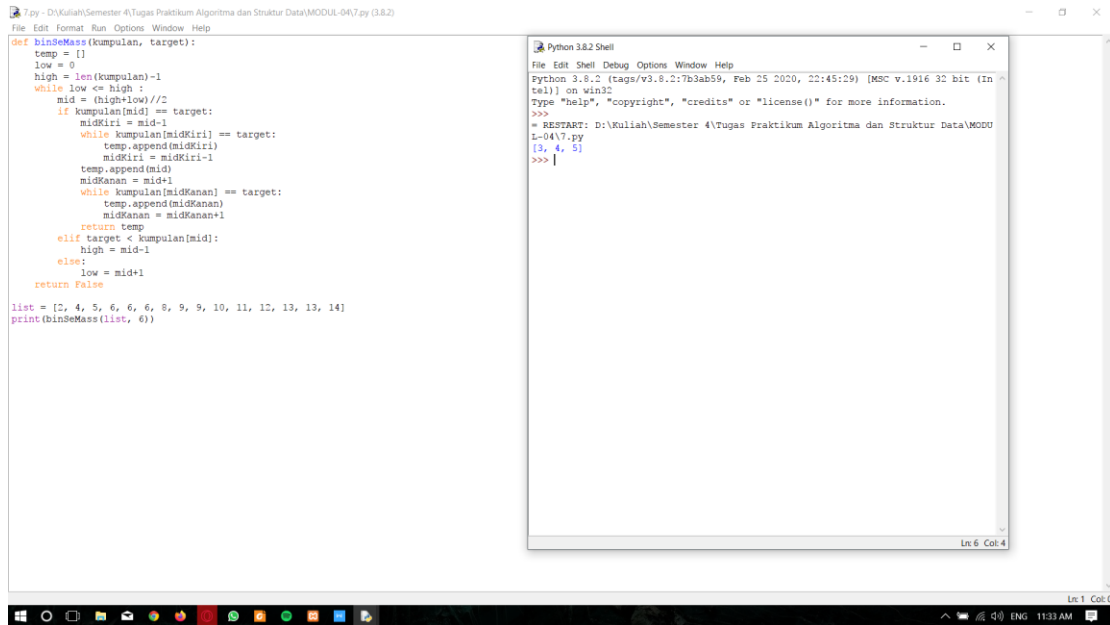

print ("nilai target :", target1)
print (binSe(list, target1))

print ("\nnilai target :", target2)
print (binSe(list, target2))
```

The second window, titled "Python 3.8.2 Shell", shows the execution of the script. It displays the Python version and system information, followed by the command `= RESTART: D:\Kuliah\Semester 4\Tugas Praktikum Algoritma dan Struktur Data\MODUL-04\6.py`. The output shows that for `target : 99`, the result is `True`, and for `target : 123`, the result is `False`.
